

Signpost

Persistent names to reach moving targets

more on
signpost.io

1 What is Signpost?

Signpost is a minimal architecture. It allows your devices to connect by resolving domain names, irrespective of network location.

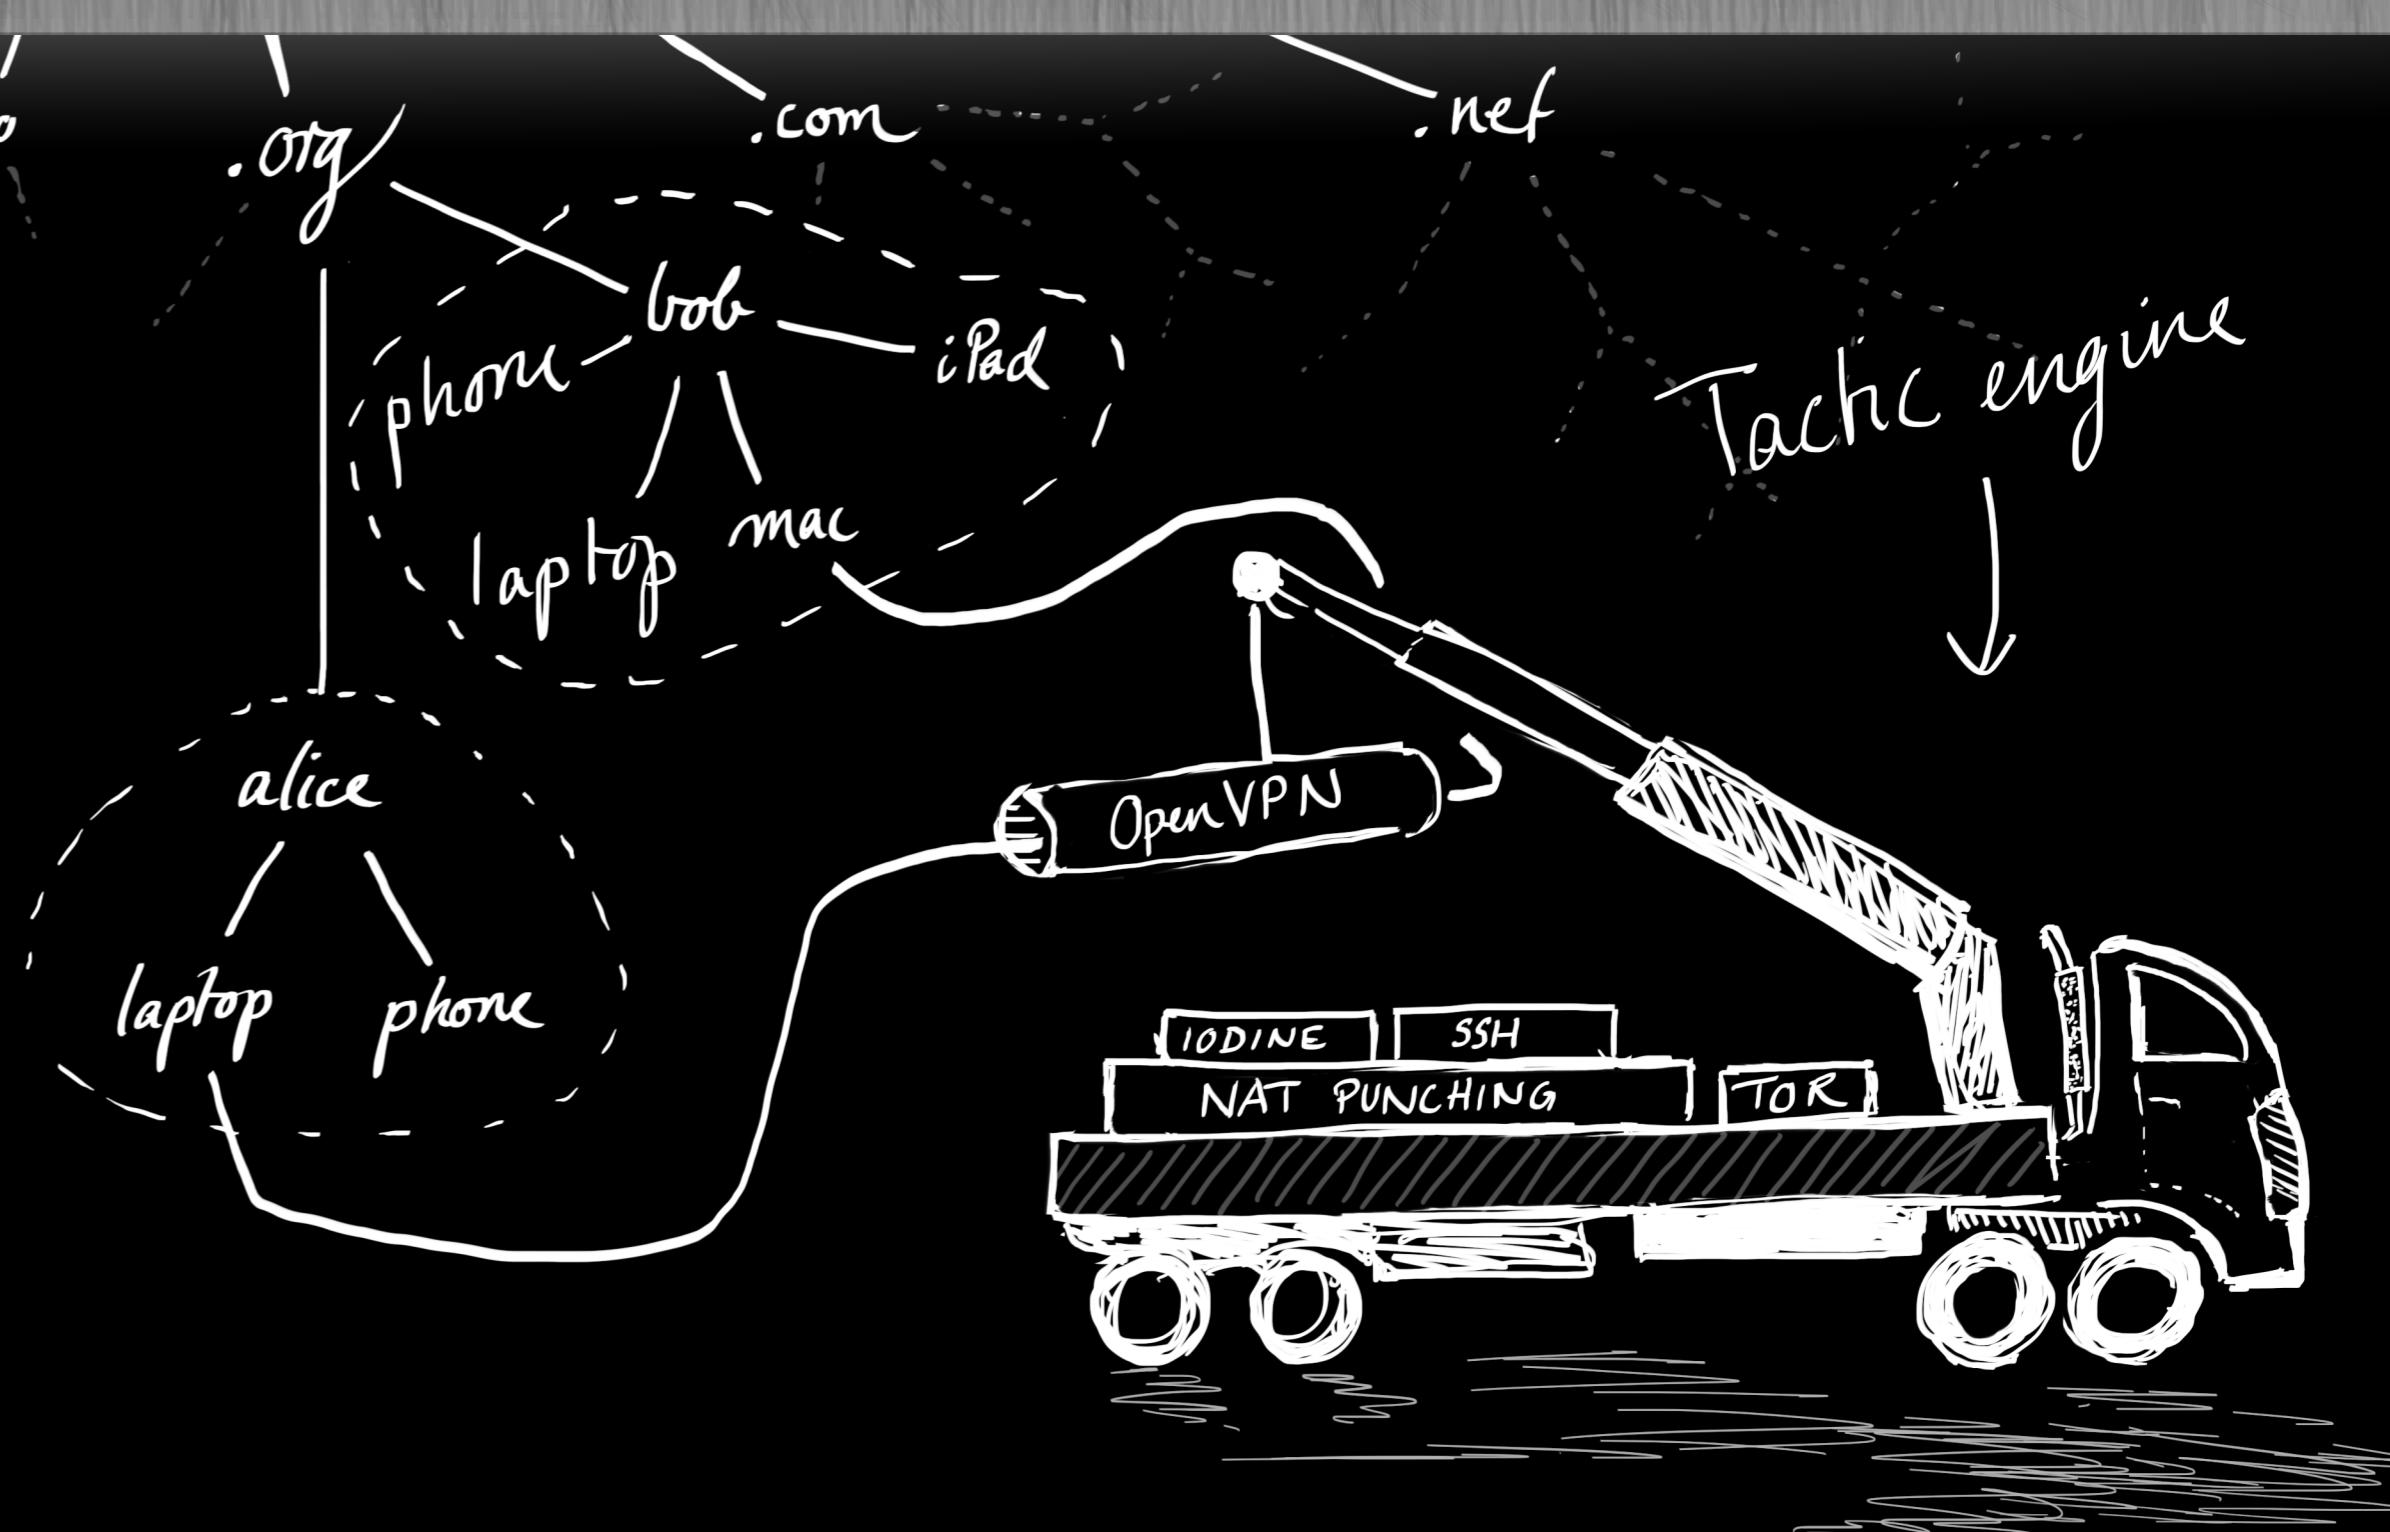

2 How does Signpost work?

Users have their own domain names.

Signpost uses **DNSSEC** for naming and signalling.

Each Signpost uses its **tactic engine** to get through middleboxes and maintain reliable connections while you are on the go.

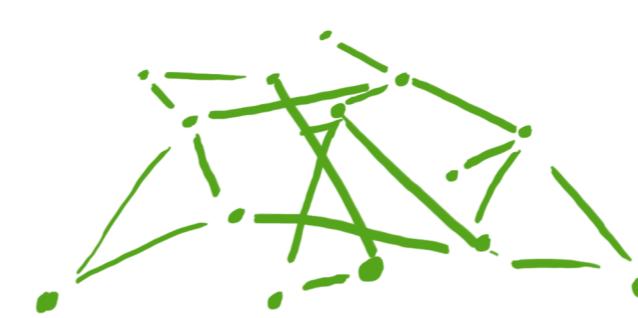

3 Why is Signpost cool?

Mobility

Security

Scalability

Identity
